

Abstract

Antiperspirant compositions containing suspended antiperspirant actives in a water-immiscible carrier leave
5 visible deposits on skin or clothing unless the actives are masked. The carrier mixture in compositions herein comprise an alkylsiloxane which is substituted by a group R^4 of formula $-CH_2-C(Ph)(R^B)-R^5-Ph$ in which R^B represents H or methyl and R^5 represents an alkylene group containing 0 to 3
10 carbons, and in which the proportion of aryl carbon atoms is at least 60% of all carbon atoms in the molecule. Preferably, the substituent comprises diphenylethyl. Optionally, the siloxane can be capped by the residue of a substituted vinyl group other than R^4 or an alkyl, cycloalkyl
15 or aralkyl alcohol.
